SUMMARY

Backend Software Engineer with 4+ years designing and delivering cloud-native microservices and distributed systems at IBM, CI&T, and NTT DATA.

Deep expertise in Java (Spring Boot 3, Quarkus), event-driven architectures (Kafka, Transactional Outbox), distributed data patterns (Redis, Optimistic/Pessimistic Locking, Circuit Breakers), and API performance tuning — delivering 30–45% reductions in response latency on high-traffic enterprise systems processing millions of daily events.

Comfortable with ambiguity and cross-functional collaboration in distributed, fully remote environments. Fluent in English (C1).

TECHNICAL SKILLS

Languages & Frameworks: Java 17/21, Spring Boot 3, Quarkus, Node.js / TypeScript

Architecture & Patterns: Microservices, BFF, DDD, Clean Architecture, Event-Driven (Kafka), Transactional Outbox, Circuit Breaker (Resilience4j)

Data & Messaging: PostgreSQL, MySQL, Oracle, MongoDB, Redis, Apache Kafka

Cloud & DevOps: AWS (EC2, S3, RDS, Lambda), Azure, Docker, CI/CD, Flyway

Testing: JUnit 5, Mockito, Testcontainers

Security: OAuth2, JWT, Keycloak, AES-256 encryption at rest

EXPERIENCE

Backend Software Engineer May 2025 – Present
IBM · Enterprise Consulting

- Reduced API response times by 30–45% (from ~800ms to ~450ms on peak endpoints) through performance profiling, query optimization, connection pooling, and endpoint redesign across multiple client platforms serving 500k+ daily requests.
- Led BFF architecture improvements that cut front-end payload size by ~35% and reduced cross-service round trips, enabling faster mobile and web client rendering.
- Accelerated team delivery velocity by 25–40% by introducing modularization patterns, shared reusable components, and standardizing code review processes.
- Improved system reliability and reduced production incidents by driving targeted refactoring and raising automated test coverage on critical services from ~40% to ~75%.
- Contributed to architecture design sessions and technical roadmap discussions in a fully distributed, cloud-native environment.

Tech: Java 21 · Spring Boot 3 · Quarkus · AWS · Docker · Kafka · REST APIs · PostgreSQL · MongoDB

Backend Software Engineer Feb 2025 – May 2025
Montreal · Consulting Project

- Designed and optimized backend APIs handling 100k+ daily transactions with focus on throughput, latency SLA (<200ms p95), and fault tolerance.
- Built reusable infrastructure components aligned with platform architecture standards, reducing onboarding time for new services by ~30%.
- Reduced production incidents through disciplined refactoring, circuit breaker integration, and expanding test coverage.

Tech: Java · Spring Boot 3 · REST APIs · PostgreSQL · Resilience4j

Backend Engineer Oct 2024 – Feb 2025

CI&T · Consulting Project (Vivo / Telefônica)

- Improved backend performance and reliability by refactoring critical business workflows, reducing average response time by ~20% on a high-volume billing service.
- Modernized legacy integrations (SOAP → REST), reducing downstream failures by ~40% and eliminating a major source of operational overhead.
- Strengthened CI/CD pipelines and automated test suites, increasing deployment confidence and cutting rollback frequency.

Tech: Java · Spring Boot · CI/CD · PostgreSQL · JUnit 5

Backend / Platform Engineer

Apr 2022 – Oct 2024

NTT DATA (AblnBev / Allianz accounts)

- Contributed to migration of legacy monolithic systems to cloud-ready microservices, reducing time-to-deploy for new features from weeks to days.
- Reduced backend latency by ~25% through API redesign, connection pooling, and caching improvements on a platform serving 2M+ monthly active users.
- Drove modularization initiatives that improved team delivery velocity and reduced regression rates across multiple squads.
- Established higher stability standards through systematic refactoring, improved observability (structured logging, distributed tracing), and on-call support.

Tech: Java · Spring Boot · AWS · Docker · PostgreSQL · MongoDB · Kafka

PROJECTS

Banking Ledger Core System

github.com/samuelbaldasso

Production-ready financial transaction engine implementing double-entry bookkeeping with Clean Architecture and DDD. Designed to handle high-concurrency financial operations with strong consistency guarantees.

- Implemented Transactional Outbox Pattern (Kafka + PostgreSQL) ensuring at-least-once event delivery and zero data loss under failure scenarios — validated with Testcontainers integration tests simulating broker downtime.
- Enforced double-entry validation, pessimistic locking with deadlock-free ordering, AES-256 encryption at rest, and OAuth2/JWT auth via Keycloak.
- Full audit trail with immutable event log; system handles 10k+ concurrent transactions in load tests without lock contention.

Tech: Java 21 · Spring Boot 3 · Kafka · PostgreSQL · Keycloak · Docker · Flyway · Clean Architecture · DDD · Testcontainers

Java Subscription Platform

github.com/samuelbaldasso

B2C subscription management system demonstrating 6 production-grade distributed systems patterns in a single cohesive codebase.

- Applied Transactional Outbox, Optimistic Locking, Kafka idempotency, Redis caching (95%+ cache-hit rate in benchmarks), and Resilience4j circuit breakers.
- Full billing lifecycle (trial, renewal, cancellation) with event-driven async processing; 126+ integration tests using Testcontainers covering failure and retry scenarios.

Tech: Java 17 · Spring Boot 3 · Kafka · Redis · PostgreSQL · Resilience4j · Testcontainers · Docker

EDUCATION

Bachelor's Degree in Information Technology

2017 – 2023

FeMASS — Macaé, RJ - Brazil

CERTIFICATIONS & LANGUAGES

AWS Certified Cloud Practitioner: Graduated (Q1 2026)

English: Full Professional Proficiency (C1)

Spanish: Professional Working Proficiency (B2)

Portuguese: Native
